

Specification Driven Implementation

Specification Driven implementations provide much more accurate and reliable pipelines than manual (mechanical) routing.

Development of the spec driven database takes some time so expect a spec driven implementation to take longer than for a manual one, but the time to develop the models will take significantly less time. Pro/PIPING provides many useful tools to help users ensure that design rules are met. Also, the specifications allow the system to determine what types of fittings can be inserted at corners, along with the flanges, etc. that may be required.
