

## RSDesigner Java Classes Available

The free Java classes that were developed by Quintic Ltd are now available for download from the Members section. These classes mostly include source code so that they can be used as examples of how to retrieve the swathes of intelligent information that exists in an RSDesigner design. These classes assist with retrieving connectivity, locating items on other sheets, assigning values to components based on connected wires and also building up cable membermaps.

In order to access them, [click here](#) to register. Or, if you are already registered then once logged in you can [click here](#) to access the classes.

Quintic no longer provide support for these classes so if you need assistance with how to use the classes then please contact CeDeL Solutions for information.
